# What is a Central Bank swap?

Swaps are **symmetric** currency exchanges

- A swap line is a contract between two Central Banks
- When activated, each institution provides an amount of its currency to the counterparty
- At maturity, positions are undone

- **Symmetric** swaps (AE-AE) potentially very different from **asymmetric** ones (AE-EM)

# What is a Central Bank swap?

which can be **asymmetric**  
in practice

- The Fed doesn't really want Mexico's pesos  
... treats them more like collateral
- Mexican authorities may need dollars for their BoP  
... more similar to borrowed reserves

- **Symmetric** swaps (AE-AE) potentially very different from **asymmetric** ones (AE-EM)

# What is a Central Bank swap?

Swaps are **symmetric** currency exchanges

- A swap line is a contract between two Central Banks
- When activated, each institution provides an amount of its currency to the counterparty
- At maturity, positions are undone

which can be **asymmetric** in practice

- The Fed doesn't really want Mexico's pesos  
... treats them more like collateral
- Mexican authorities may need dollars for their BoP  
... more similar to borrowed reserves

- **Symmetric** swaps (AE-AE) potentially very different from **asymmetric** ones (AE-EM)

# How are Central Bank Swap Lines different from Sovereign Debt?

For an EM using the swap line to borrow from an AE

## Regular debt (bond markets)

- Defaultable
- Many different lenders
- Interest rate (spreads) mainly reflects default risk

## Bilateral loan (swap line)

- Non-defaultable (Central Bank)
- No coordination issues
- Can be used to curb default risk
- Interest rate?

# How do Central Bank Swap Lines interact with Sovereign Debt?

---

## Main findings

- One type of debt affects borrowing conditions for the other
  - Borrowing from the market serves as explicit threat in swap negotiations
  - Swap can be used when spreads on the market are high
- Lending around or in default maximizes surplus for bilateral loans
- Without restricting swaps in default, **welfare losses** for government
- Bilateral debt worsens the **debt dilution** problem

# Roadmap

---

Model with Swaps only

Model with Swaps and Debt

Concluding remarks

## Model with Swaps only

---

The government of a small open economy borrows from a monopolist

- Income  $y(z_t)$  follows an AR(1) process in logs
- Renegotiate the loan each period  $m$ 
  - ... Involves a transfer  $x$  and a new loan size  $m'$
- The loan is non-defaultable
  - ... Repaying the whole amount is a natural threat point
- Should expect
  - ... Interest rate to vary over time
  - ... Interest rate to reflect market power
  - ... Interest rate to reflect outside options

The government of a small open economy borrows from a monopolist

  - ... Interest rate to vary over time
  - ... Interest rate to reflect market power
  - ... Interest rate to reflect outside options

# Bargaining stage with monopolist

- At income state  $z$  and loan  $m$ , solve

$$\max_{x, m'} \mathcal{L}(x, m, m', z)^\theta \times \mathcal{B}(x, m, m', z)^{1-\theta}$$

- Government (borrower) surplus

$$\mathcal{B}(x, m, m', z) = \underbrace{u(y(z) + x) + \beta \mathbb{E}[v(m', z') | z]}_{\text{agreement: receive } x, \text{ owe } m'} - \underbrace{(u(y(z) - m) + \beta \mathbb{E}[v(0, z') | z])}_{\text{threat point: repay } m, \text{ clean slate}}$$

- Lender surplus

$$\mathcal{L}(x, m, m', z) = \underbrace{a - x + \beta_L \mathbb{E}[h(m', z') | z]}_{\text{agreement}} - \underbrace{(a + m + \beta_L \mathbb{E}[h(0, z') | z])}_{\text{threat point}}$$

- Value functions  $v(m, z)$  and  $h(m, z)$  encode expected outcomes of future rounds

## Bargaining stage with monopolist

- At income state  $z$  and loan  $m$ , solve

- Value functions  $v(m, z)$  and  $h(m, z)$  encode expected outcomes of future rounds

## Swap Line Terms: Loan Dynamics

## Swap Line Terms: Transfers

## Swap Line Terms: Interest rate

## Swap Line Terms: Borrower's value function

## Swap Line Terms: Lender's value function

## Swap Line Terms: Takeaways

---

The threat point is less 'credible' when  $m$  is large

- This creates convexity in the lender's value function  
... making the lender act 'as if' risk-loving
- The lender initially subsidizes the loan to induce indebtedness and high profits
- Gamble for debt overhang
- Initial subsidy and high rates consistent with B's risk aversion – 'Participation constraint'

## Model with Swaps and Debt

---

# Timeline of events

## Borrowing from markets

- Debt is a geometrically-decaying coupon  
... get 1, pay  $\kappa, (1 - \rho)\kappa, \dots (1 - \rho)^{s-1}\kappa$
- Government enters first stage owing  $b$  in debt,  $m$  in swaps, income state  $z$

$$v(b, m, z) = \max \{ v_R(b, m, z) + \epsilon_R, v_D(m, z) + \epsilon_D \}$$
$$v_R(b, m, z) = \max_{b'} w_R(b', b, m, z)$$

- Lenders in competitive markets need to anticipate interactions with the monopolist

$$q(b', b, m, z) = \frac{1}{1+r} \mathbb{E} [(1 - 1_D(b', m', z')) (\kappa + (1 - \rho)q(b'', b', m', z')) \mid z]$$
$$m' = m'(b', b, m, z)$$

- Debt is a geometrically-decaying coupon  
... get 1, pay  $\kappa, (1 - \rho)\kappa, \dots (1 - \rho)^{s-1}\kappa$
- Government enters first stage owing  $b$  in debt,  $m$  in swaps, income state  $z$

$$v(b, m, z) = \max \{ v_R(b, m, z) + \epsilon_R, v_D(m, z) + \epsilon_D \}$$
$$v_R(b, m, z) = \max_{b'} w_R(b', b, m, z)$$

- Lenders in competitive markets need to anticipate interactions with the monopolist

$$q(b', b, m, z) = \frac{1}{1+r} \mathbb{E} [(1 - 1_D(b', m', z')) (\kappa + (1 - \rho)q(b'', b', m', z')) \mid z]$$
$$m' = m'(b', b, m, z)$$

- Similar to the case with swaps only with extra state variables ( $b, b'$ )

$$\mathcal{L}_R(b', x, m, m', z) = -x - m + \beta_L \mathbb{E} [h(b', m', z') - h(b', 0, z') \mid z]$$

$$\begin{aligned} \mathcal{B}_R(b', b, x, m, m', z) &= u(y(z) + P(b', b, m, z) + x) - u(y(z) + P(b', b, m, z) - m) \\ &\quad + \beta \mathbb{E} [v(b', m', z') - v(b', 0, z') \mid z] \end{aligned}$$

$$P(b', b, m, z) = q(b', b, m, z)(b' - (1 - \rho)b) - \kappa b$$

## Default probability

Both types of debt are clearly **complements**

## When is the Swap Used?

---

- In repayment, average swap = XXXX with s.d. YYYY
- In default,
- Also consider Limited version:  $m' \leq m$  while in default

## When is the Swap Used?

---

- In repayment, average swap = XXXX with s.d. YYYY
- In default,
- Also consider Limited version:  $m' \leq m$  while in default

# Debt Tolerance with Swaps

More repayment with **Limited** and with bargaining power

# Debt Prices with Swaps

More repayment with Limited but still lower **prices** — Tell-tale sign of **debt dilution**

# Welfare effects of swap lines

with interior bargaining power, Limited  $\succcurlyeq$  Unrestricted, but...

# Welfare effects of swap lines — Debt dilution

Resolving with **short-term debt**: losses from Limited, gains of swaps (but not for all  $\theta$ )

## Concluding remarks

---

## Concluding remarks

---

- Simple model with monopolist/fringe structure
- Strong interaction between two markets for sovereign debt
  - ... even if swaps are not used intensely on the equilibrium path
- Market power crucial in model
  - ... how to discipline in model?
  - ... how to affect in reality?
- Large welfare effects, policy challenges
  - How to limit their use during defaults?
  - Strengthen debt dilution – more gains from fiscal rules, state-contingent debt?
