Official Sovereign Debt

- A large share of sovereign borrowing takes the form of official debt
  … Multilaterals, development banks, other governments

- Emergence of new bilateral creditors outside the Paris Club ▸ IDS data
  … with claims to seniority and sometimes **confidential** terms

Questions

- How does the presence of a large senior lender affect sovereign debt markets?
- What are its welfare implications for borrowing governments?

Official Sovereign Debt

- A large share of sovereign borrowing takes the form of official debt

  … Multilaterals, development banks, other governments

- Emergence of new bilateral creditors **outside** the Paris Club ▸ IDS data

  … with claims to seniority and sometimes **confidential** terms

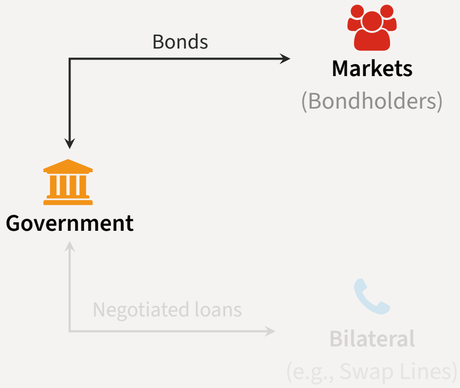
Questions

- How does the presence of a large senior lender affect sovereign debt markets?
- What are its welfare implications for borrowing governments?

Evaluating Senior Official Creditors

Quantitative sovereign debt model with

- Competitive creditors in private markets
- Large bilateral lender
    1. Superior enforcement [de-facto seniority]
    2. Bargained terms [price and quantity]
    3. Short-maturity loans
- Prime example: Central Bank swap lines (Horn et al., 2021)
- Focus on the interaction between both funding sources



Evaluating Senior Official Creditors

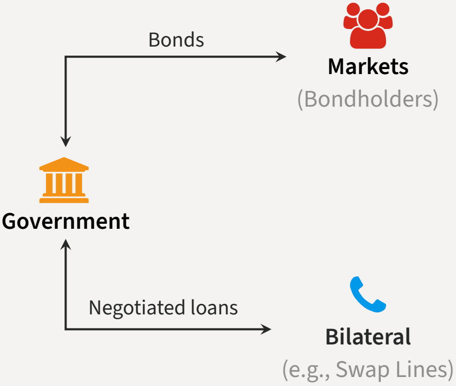
  (Horn et al., 2021)



- Focus on the interaction between both funding sources

Relational Overborrowing

Main findings

- Bilateral loans have significant effects on equilibrium outcomes
  ... provide funding when other sources dry up (e.g. because of default risk)
  ... can also incentivize more **risk-taking**

- If the rate on bilateral loans is decreasing in *market* debt [cross-elasticity]
  ... government issues market debt more quickly, delevers more slowly
  ... spends longer in the risky region
  ... defaults more frequently
  ... welfare losses for the government

- Cross-elasticity can emerge endogenously from bargaining
  ... at plausible values for bargaining weights
  ... increased frequency of defaults dominates extra liquidity
  ... **relational overborrowing**

  - Endogenous Bargaining
- Concluding remarks

Theory

Theory

Bargaining and the Cross-Elasticity

Bargaining Induces a Cross-Elasticity

- Two periods $t \in \{0, 1\}$, endowments $y_0 < y_1$
- Government discount factor β, lender's discount factor $\beta_L > \beta$
- **Bargaining** transfer x at $t = 0$ for repayment $x(1 + r)$ at $t = 1$, weight θ for lender

$$\max_{x,r} \mathcal{L}(x, r)^{\theta} \times \mathcal{B}(x, r; y_0, y_1)^{1-\theta}$$

where

$$\mathcal{L}(x, r) = \underbrace{-x + \beta_L x(1 + r)}_{\text{agreement}}$$

$$\mathcal{B}(x, r; y_0, y_1) = \underbrace{u(y_0 + x) + \beta u\left(y_1 - x(1 + r)\right)}_{\text{agreement}} - \underbrace{\left(u(y_0) + \beta u\left(y_1\right)\right)}_{\text{threat point}}$$

Bargaining Induces a Cross-Elasticity

- Two periods $t \in \{0, 1\}$, endowments $y_0 < y_1$
- Government discount factor β, lender's discount factor $\beta_L > \beta$
- **Bargaining** transfer x at $t = 0$ for repayment $x(1+r)$ at $t = 1$, weight θ for lender

$$\max_{x,r} \mathcal{L}(x, r)^{\theta} \times \mathcal{B}(x, r; y_0, y_1)^{1-\theta}$$

where

$$\mathcal{L}(x, r) = \underbrace{-x + \beta_L x(1+r)}_{\text{agreement}}$$

$$\mathcal{B}(x, r; y_0, y_1) = \underbrace{u(y_0 + x) + \beta u\left(y_1 - x(1+r)\right)}_{\text{agreement}} - \underbrace{\left(u(y_0) + \beta u\left(y_1\right)\right)}_{\text{threat point}}$$

Bargaining Induces a Cross-Elasticity

- Two periods $t \in \{0, 1\}$, endowments $y_0 < y_1$
- Government discount factor β, lender's discount factor $\beta_L > \beta$
- **Bargaining** transfer x at $t = 0$ for repayment $x(1+r)$ at $t = 1$, weight θ for lender

$$\max_{x,r} \mathcal{L}(x, r)^{\theta} \times \mathcal{B}(x, r; y_0, y_1)^{1-\theta}$$

where

$$\mathcal{L}(x, r) = \underbrace{-x + \beta_L x(1+r)}_{\text{agreement}}$$

$$\mathcal{B}(x, r; y_0, y_1) = \underbrace{u(y_0 + x) + \beta u\left(y_1 - x(1+r)\right)}_{\text{agreement}} - \underbrace{\left(u(y_0) + \beta u\left(y_1\right)\right)}_{\text{threat point}}$$

Bargaining Induces a Cross-Elasticity

- First-order conditions for bargaining problem

$$u'(y_0 + x) = \frac{\theta}{1-\theta} \frac{\mathcal{B}(x,r;y_0,y_1)}{\mathcal{L}(x,r)}$$

Surplus sharing

$$u'(y_0 + x) = \frac{\beta}{\beta_L} u'\left(y_1 - x(1+r)\right)$$

Euler

- Can prove that

$$\frac{\partial x}{\partial y_0} \leq 0 \qquad \text{and} \qquad \frac{\partial r}{\partial y_0} \leq 0$$

- **Later** y_0, y_1 are given by market debt dynamics, so
  - Recent issuances: increases y_0 and decreases y_1, makes you stronger
  - Legacy debt: lowers y_0 and y_1, typically makes you weaker

Bargaining Induces a Cross-Elasticity

- First-order conditions for bargaining problem

$$u'(y_0 + x) = \frac{\theta}{1-\theta} \frac{\mathcal{B}(x, r; y_0, y_1)}{\mathcal{L}(x, r)}$$

Surplus sharing

$$u'(y_0 + x) = \frac{\beta}{\beta_L} u'\left(y_1 - x(1 + r)\right)$$

Euler

- Can prove that

$$\frac{\partial x}{\partial y_0} \leq 0 \qquad \text{and} \qquad \frac{\partial r}{\partial y_0} \leq 0$$

- **Later** y_0, y_1 are given by market debt dynamics, so
  - Recent issuances: increases y_0 and decreases y_1, makes you stronger
  - Legacy debt: lowers y_0 and y_1, typically makes you weaker

Bargaining Induces a Cross-Elasticity

- First-order conditions for bargaining problem

$$u'(y_0 + x) = \frac{\theta}{1-\theta}\frac{\mathcal{B}(x,r;y_0,y_1)}{\mathcal{L}(x,r)}$$ Surplus sharing

$$u'(y_0 + x) = \frac{\beta}{\beta_L}u'\left(y_1 - x(1+r)\right)$$ Euler

- Can prove that

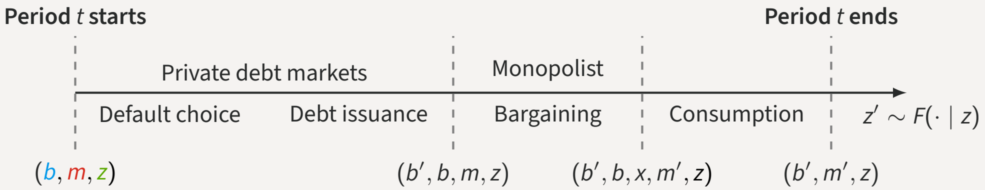
$$\frac{\partial x}{\partial y_0} \leq 0 \qquad \text{and} \qquad \frac{\partial r}{\partial y_0} \leq 0$$

- **Later** y_0, y_1 are given by market debt dynamics, so
  - Recent issuances: increases y_0 and decreases y_1, makes you stronger
  - Legacy debt: lowers y_0 and y_1, typically makes you weaker

Quantitative Model

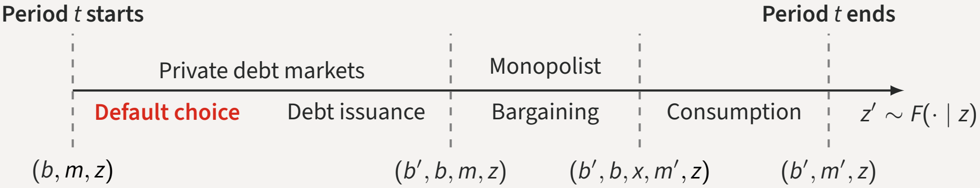
Timeline of Events

- Enter period t owing b to bondholders, m to monopolist, income $y(z)$



Timeline of Events

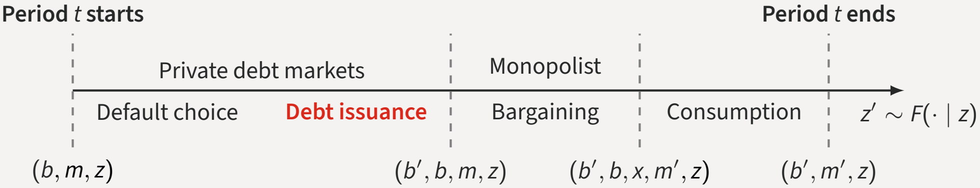
- Choose to repay or default the *market* debt subject to convex output costs



$$v(b, m, z) = \max\left\{v_R(b, m, z) + \epsilon_R, v_D(m, z) + \epsilon_D\right\}$$

Timeline of Events

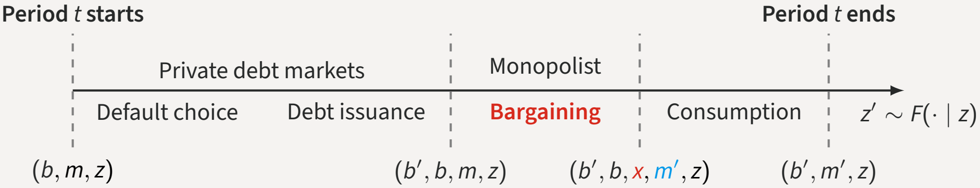
- If repaid, issue new (long-term) debt b' in markets at price q [coupon rate κ, maturity $1/\delta$]



$$q(b', b, m, z) = \beta_L \mathbb{E}\left[\left(1 - 1_{\mathcal{D}}(b', m', z')\right)\left(\kappa + (1-\delta) q(b'', b', m', z')\right) \mid z\right]$$

Timeline of Events

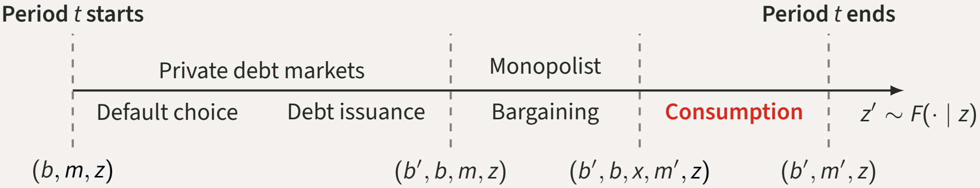
- Meet with senior lender, decide any transfers x and new/remaining balance m'



$$r(x, m', m) = \frac{m'}{x + m} - 1$$

Timeline of Events

- Consume output plus revenues from debt issuance plus transfers minus debt service



$$c_R = y(z) + q(b', b, m, z)(b' - (1 - \delta)b) + x_R(b', b, m, z) - \kappa b$$

$$c_D = y(z) - h(z) + x_D(m, z); \qquad x_D(m, z) \leq \Gamma(m)$$

Calibration

- Standard strategy in sovereign debt: match Argentina 1993-2001 to model w/o swaps

	Parameter	Value

Quantitative Model

Endogenous Bargaining

Bargaining Stage with Monopolist

- At state z, owing debt b bonds and m on the loan and having issued b'

Government surplus

$$\max_{x,m'} \mathcal{L}_R(b', x, m, m', z)^{\theta} \times \mathcal{B}_R(b', b, x, m, m', z)^{1-\theta}$$

Lender surplus

- Lender's surplus

$$\mathcal{L}_R(b', x, m, m', z) = \underbrace{\left(-x + \beta_L \mathbb{E}\left[h(b', m', z') \mid z\right]\right)}_{\text{agreement}} - \underbrace{\left(m + \beta_L \mathbb{E}\left[h(b', 0, z') \mid z\right]\right)}_{\text{threat point}}$$

- Government's surplus

$$\mathcal{B}_R(b', b, x, m, m', z) = \underbrace{u\left(y(z) + B(b', b, m, z) + x\right) + \beta \mathbb{E}\left[v(b', m', z') \mid z\right]}_{\text{agreement}}$$
$$- \underbrace{\left(u\left(y(z) + B(b', b, m, z) - m\right) + \beta \mathbb{E}\left[v(b', 0, z') \mid z\right]\right)}_{\text{threat point}}$$

with $B(b', b, m, z) = q(b', b, m, z)(b' - (1-\delta)b) - \kappa b$

Bargaining Stage with Monopolist

- At state z, owing debt b bonds and m on the loan and having issued b'

$$\max_{x,m'} \mathcal{L}_R(b', x, m, m', z)^{\theta} \times \mathcal{B}_R(b', b, x, m, m', z)^{1-\theta}$$

- Lender's surplus

same sdf as markets

$$\mathcal{L}_R(b', x, m, m', z) = \underbrace{\left(-x + \beta_L \mathbb{E}\left[h(b', m', z') \mid z\right]\right)}_{\text{agreement}} - \underbrace{\left(m + \beta_L \mathbb{E}\left[h(b', 0, z') \mid z\right]\right)}_{\text{threat point}}$$

- Government's surplus

$$\mathcal{B}_R(b', b, x, m, m', z) = \underbrace{u\left(y(z) + B(b', b, m, z) + x\right) + \beta \mathbb{E}\left[v(b', m', z') \mid z\right]}_{\text{agreement}}$$

$$- \underbrace{\left(u\left(y(z) + B(b', b, m, z) - m\right) + \beta \mathbb{E}\left[v(b', 0, z') \mid z\right]\right)}_{\text{threat point}}$$

with $B(b', b, m, z) = q(b', b, m, z)(b' - (1-\delta)b) - \kappa b$

Bargaining Stage with Monopolist

- At state z, owing debt b bonds and m on the loan and having issued b'

$$\max_{x,m'} \mathcal{L}_R(b', x, m, m', z)^{\theta} \times \mathcal{B}_R(b', b, x, m, m', z)^{1-\theta}$$

- Lender's surplus

$$\mathcal{L}_R(b', x, m, m', z) = \underbrace{\left(-x + \beta_L \mathbb{E}\left[h(b', m', z') \mid z\right]\right)}_{\text{agreement}} - \underbrace{\left(m + \beta_L \mathbb{E}\left[h(b', 0, z') \mid z\right]\right)}_{\text{threat point}}$$

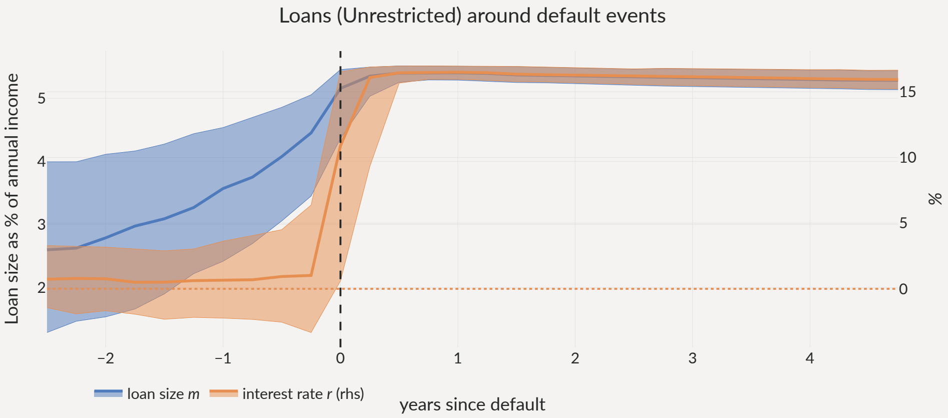
- Government's surplus

$$\mathcal{B}_R(b', b, x, m, m', z) = \underbrace{u\big(y(z) + B(b', b, m, z) + x\big) + \beta \mathbb{E}\left[v(b', m', z') \mid z\right]}_{\text{agreement}}$$
$$- \underbrace{\left(u\big(y(z) + B(b', b, m, z) - m\big) + \beta \mathbb{E}\left[v(b', 0, z') \mid z\right]\right)}_{\text{threat point}}$$

with $B(b', b, m, z) = q(b', b, m, z)(b' - (1-\delta)b) - \kappa b$

Usage of Loans

- Sharp acceleration before defaults, maxed out *in* default if possible



Limiting Loans in Default

- **Limited**: cannot borrow in default $\Gamma(m) = m$ **Unavailable**: $\Gamma(m) = 0$

	Only market	Unrestricted, θ = 0.5	Limited, θ = 0.5	Unavailable, θ = 0.5

Welfare gains (rep)	–	-0.095%	-0.038%	0.12%

Note Statistics from each ergodic distribution

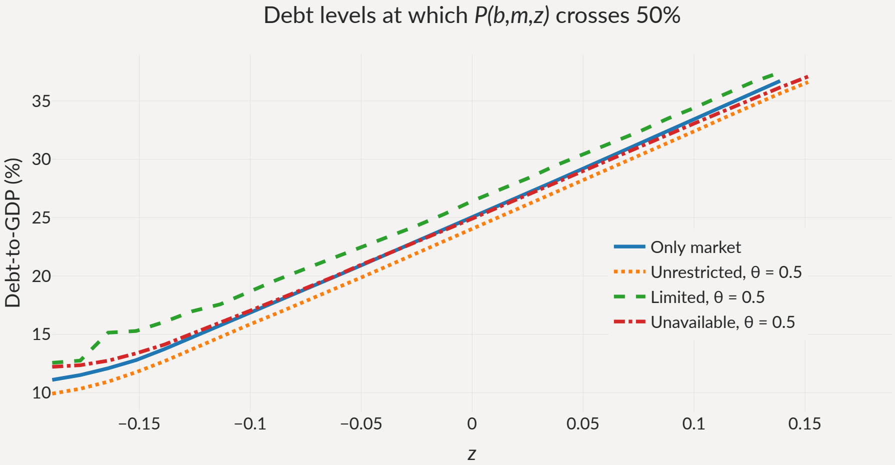
Default Barriers with Loans

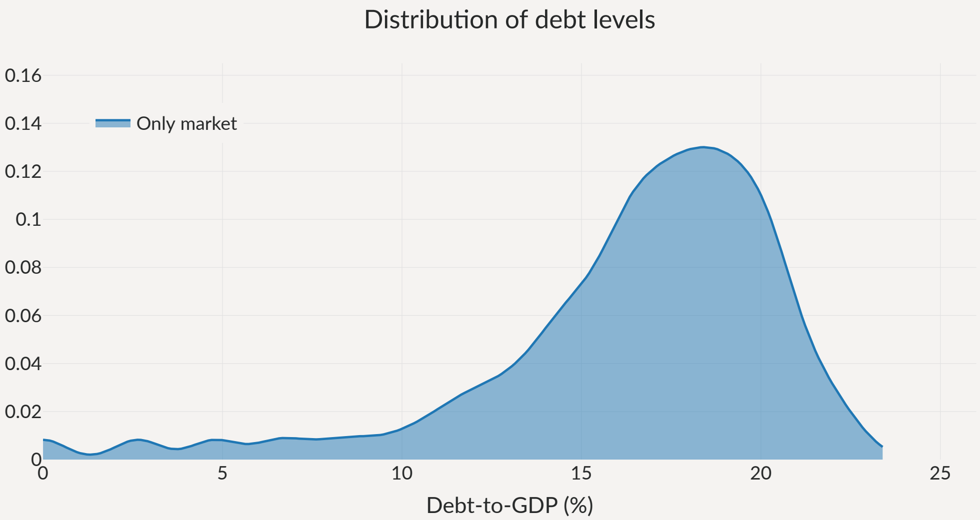
- Unrestricted: default barrier marginally inward, others marginally *outward*



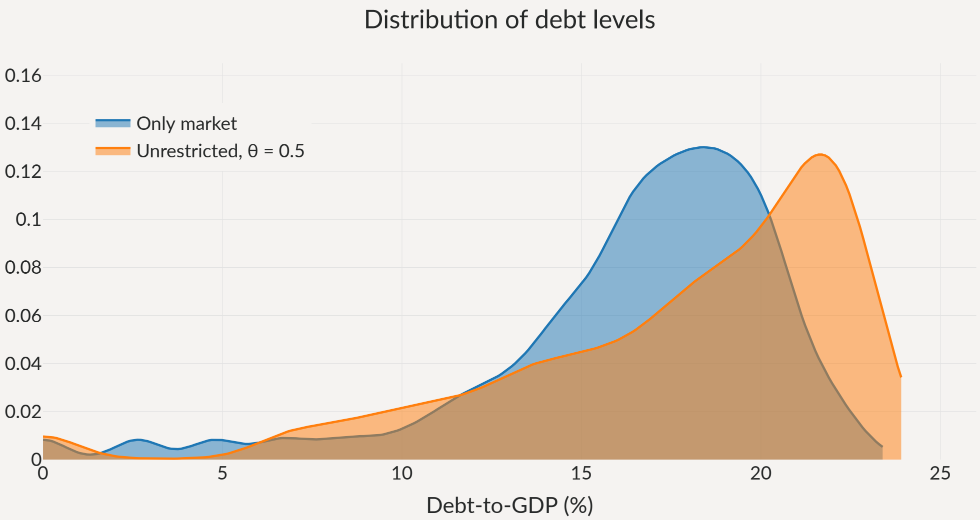
If Loans help repay the debt,

Why are there **more** defaults with loans?

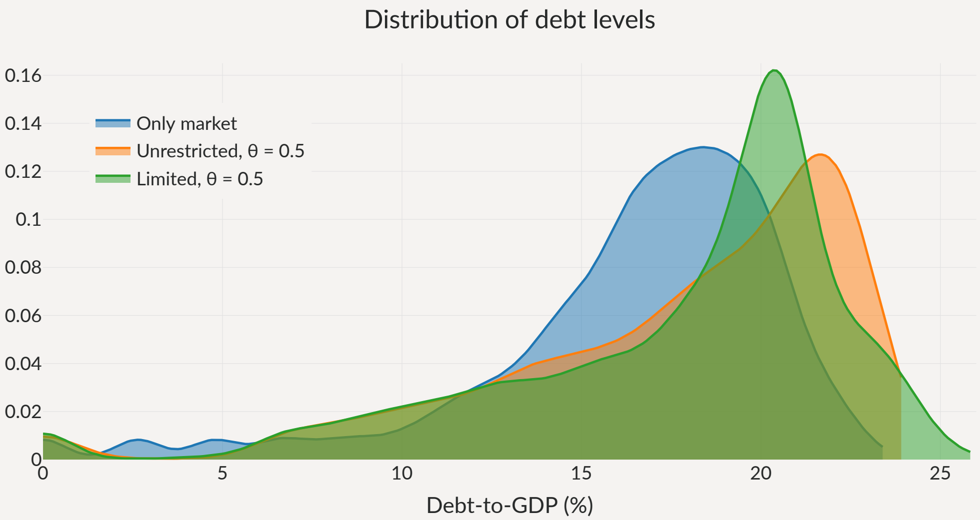
Debt Levels with Loans



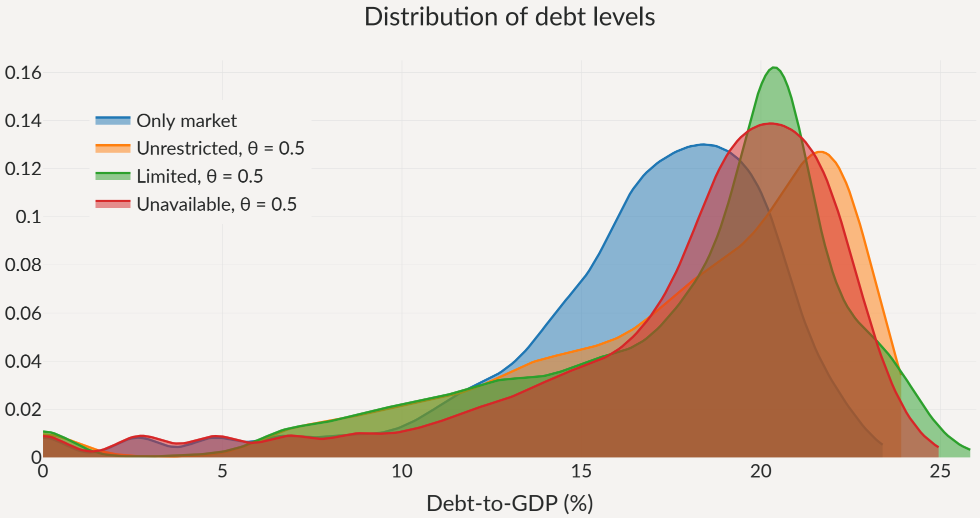
Debt Levels with Loans



Debt Levels with Loans



Debt Levels with Loans



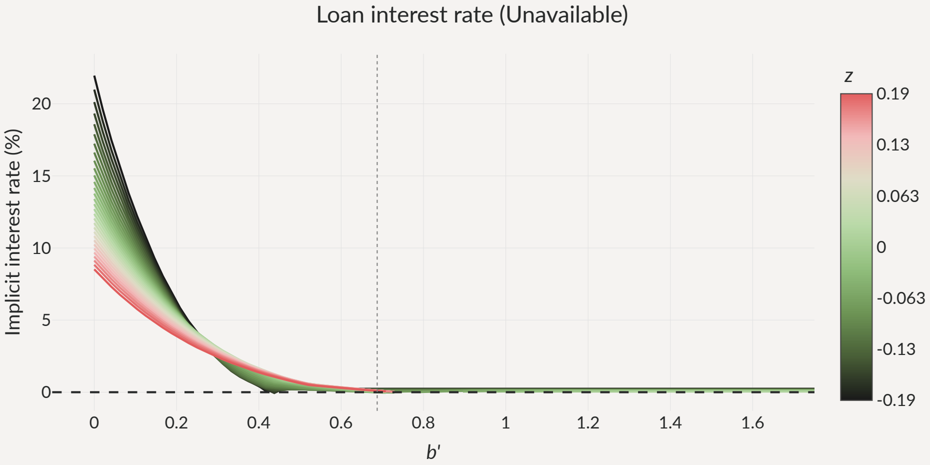
Government's surplus

$$\mathcal{B}_R(b', b, x, m, m', z) = u\big(y(z) + B(b', b, m, z) + x\big) + \beta\mathbb{E}\left[v(b', m', z') \mid z\right] \\ - \Big(u\big(y(z) + B(b', b, m, z) - m\big) + \beta\mathbb{E}\left[v(b', 0, z') \mid z\right]\Big)$$

- Revenues from debt issuance $B(b', b, m, z)$ modulate the value of the threat point
  - After large revenues (high q, high b'), gov't flush with cash, **strong** in bargaining
  - After bad issuance (low q *or* low b'), gov't **weak** in bargaining

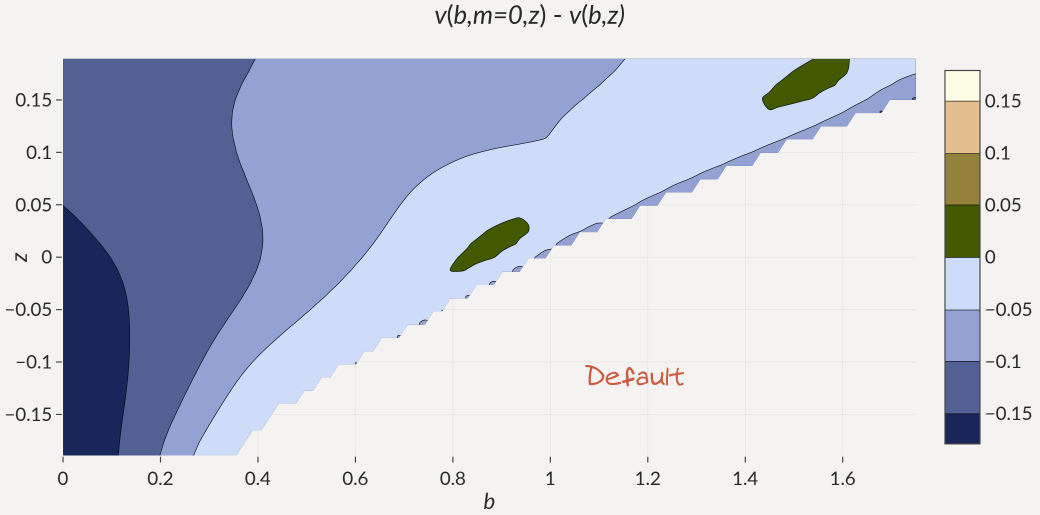
Risk-taking Incentives

Threat point manipulation: increase market b' to reduce bilateral r **Cross-elasticity**

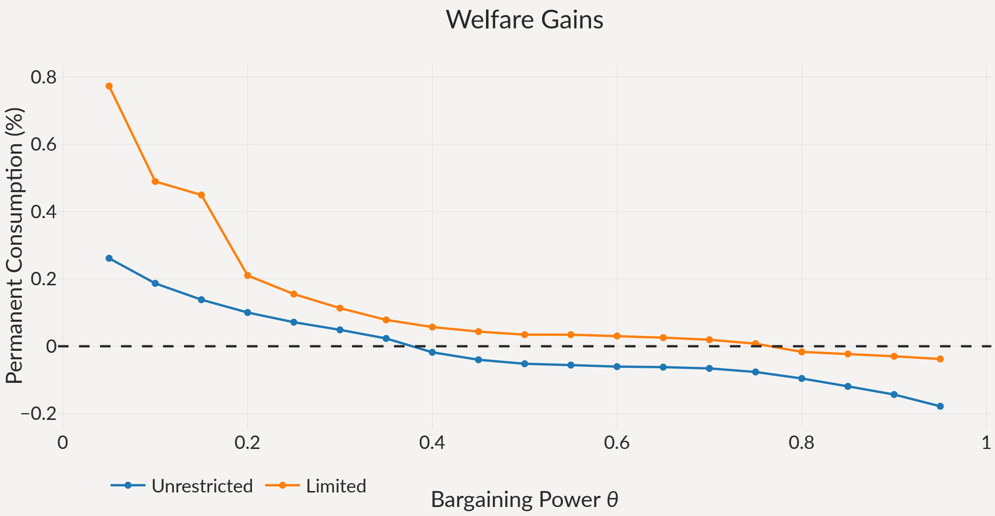


Welfare Effects of Bilateral Loans

Overall welfare effect small: more risk, but more frontloading in short run.



Bargaining Power and Welfare



Concluding remarks

The Perils of Bilateral Sovereign Debt

- Simple model of borrowing from markets and a senior bilateral lender

  … strong interaction between two markets for sovereign debt

  … even if bilateral loans are **not** used intensely on the equilibrium path

- **Dangerous** when bilateral interest rate responds negatively to *market* debt

  … cross-elasticity induces risk-taking, more defaults, welfare losses

  … Bargaining as an example of situation where cross-elasticity emerges

- Cross-elasticity constitutes a simple test to assess welfare gains of **new** instruments

  … or a boost to the gains of fiscal rules, state-contingent debt…
