What is a Central Bank swap?

Swaps are symmetric currency exchanges

- A swap line is a contract between two Central Banks
- When activated, each institution provides an amount of its currency to the counterparty
- · At maturity, positions are unwound

Symmetric swaps (AE-AE) potentially very different from asymmetric ones (AE-EM)
 Symmetric swaps better understood, growing number of asymmetric ones

What is a Central Bank swap?

which can be asymmetric in practice

- The Fed doesn't really want Mexico's pesos
 - ... treats them more like collateral
- Mexican authorities may need dollars for their BoP
 - ... more similar to borrowed reserves
- Symmetric swaps (AE-AE) potentially very different from asymmetric ones (AE-EM)
 ... Symmetric swaps better understood, growing number of asymmetric ones

How are Central Bank Swap Lines different from Sovereign Debt?

We abstract from currencies, collateral, and focus on the borrowing

For an EM using the swap line to borrow from an AE

Regular debt (bond markets)

- Defaultable
- Many different lenders
- Interest rate (spreads) mainly reflects default risk

Bilateral Ioan (swap line)

- Non-defaulteable (Central Bank)
- No coordination issues
- Can be used to curb default risk
- Interest rate?

How are Central Bank Swap Lines different from Sovereign Debt?

· We abstract from currencies, collateral, and focus on the borrowing

For an EM using the swap line to borrow from an AE

Regular debt (bond markets)

- · Defaultable
- Many different lenders
- Interest rate (spreads) mainly reflects default risk

Bilateral loan (swap line)

- Non-defaulteable (Central Bank)
- No coordination issues
- · Can be used to curb default risk
- Interest rate?

How do Central Bank Swap Lines interact with Sovereign Debt?

Main findings

- · One type of debt affects borrowing conditions for the other
 - · Borrowing from the market serves as threat in swap negotiations
 - · Swap can be used when spreads on the market are high
- · Lending around or in default maximizes surplus for bilateral loans
 - Availability of swaps in default:
 - ... raises the value of default
 - ... which increases the default frequency
 - ... and worsens borrowing terms in bond markets
 - · Without restricting swaps in default, welfare losses for the government
- · Swap lines worsen the debt dilution problem

Literature

- · Central Bank swaps among advanced economies
 - ... Bahaj and Reis (2021); Cesa-Bianchi, Eguren-Martin, and Ferrero (2022)

Model with Swaps only

Environment

The government of a small open economy borrows from a monopolist

- · Income $y(z_t)$ follows an AR(1) process in logs
 - ... Only one good, representative risk-averse household, expected utility
- · Renegotiate the swap *m* each period
 - ... Involves a transfer x and a new loan size m'
 - ... Swap is non-defaultable \implies Repaying m is the natural threat point
- Should expect

 $x = \frac{1}{1+r}m' - m$

- ... Implicit interest rate r to vary over time
- ... Interest rate to reflect market power
- ... Interest rate to reflect outside options

Environment

Lender surplus

$$\mathcal{L}(\mathbf{x}, \mathbf{m}, \mathbf{m}', \mathbf{z}) = \underbrace{a - \mathbf{x} + \beta_L \mathbb{E}\left[h(\mathbf{m}', \mathbf{z}') \mid \mathbf{z}\right]}_{\text{agreement}} - \underbrace{\left(a + \mathbf{m} + \beta_L \mathbb{E}\left[h(\mathbf{0}, \mathbf{z}') \mid \mathbf{z}\right]\right)}_{\text{threat point}}$$

· Value functions v(m, z) and h(m, z) encode expected outcomes of future rounds

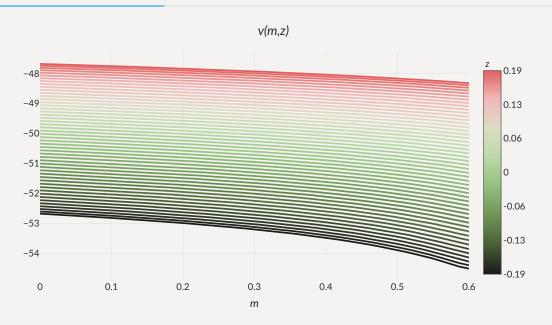

Swap Line Terms: Loan Dynamics

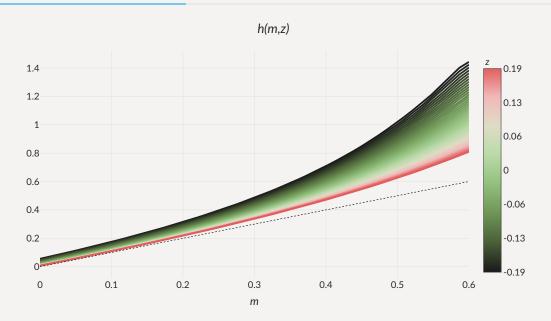

Swap Line Terms: Implicit interest rate

Swap Line Terms: Borrower's value function

Swap Line Terms: Lender's value function

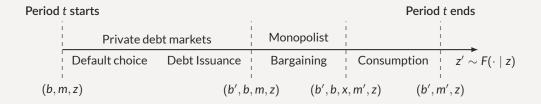

Swap Line Terms: Takeaways

- · This creates convexity in the lender's value function
 - ... making the lender act 'as if' risk-loving
- · The lender initially subsidizes the loan to induce indebtedness and high profits
 - Gamble for debt overhang
- · Initial subsidy and high rates consistent with B's risk aversion 'Participation constraint'

Model with Swaps and Debt

Timeline of events

Borrowing from markets

Debt is a geometrically-decaying coupon

... get 1, pay
$$\kappa$$
, $(1-\rho)\kappa$, ... $(1-\rho)^{s-1}\kappa$

· Government enters first stage owing b in debt, m in swaps, income state z

$$v(b, m, z) = \max \{v_R(b, m, z) + \epsilon_R, v_D(m, z) + \epsilon_D\}$$
$$v_R(b, m, z) = \max_{b'} w_R(b', b, m, z)$$

 \cdot Lenders in competitive markets need to anticipate interactions with the monopolist

$$egin{aligned} q(b',b,m,z) &= eta_{\mathsf{L}} \mathbb{E} \left[(\mathbf{1} - \mathbf{1}_{\mathcal{D}}(b',\mathbf{m}',z')) \left(\kappa + (\mathbf{1} -
ho) q(b'',b',\mathbf{m}',z') \right) \mid z
ight] \ m' &= m'(b',b,m,z) \ b'' &= b'(b',m',z') \end{aligned}$$

Borrowing from markets

$$v(b, m, z) = \max \{v_R(b, m, z) + \epsilon_R, v_D(m, z) + \epsilon_D\}$$
$$v_R(b, m, z) = \max_{b'} w_R(b', b, m, z)$$

· Lenders in competitive markets need to anticipate interactions with the monopolist

Bargaining stage

• Same as before with extra state variables (b, b')

$$\mathcal{L}_{R}(b', x, m, m', z) = (a - x + \beta_{L}\mathbb{E} [h(b', m', z') \mid z]) - (a + m + \beta_{L}\mathbb{E} [h(b', 0, z') \mid z])$$

$$\mathcal{B}_{R}(b', b, x, m, m', z) = u(y(z) + B(b', b, m, z) + x) + \beta\mathbb{E} [v(b', m', z') \mid z] - (u(y(z) + B(b', b, m, z) - m) + \beta\mathbb{E} [v(b', 0, z') \mid z])$$

$$B(b', b, m, z) = q(b', b, m, z)(b' - (1 - \rho)b) - \kappa b$$

Quantitative Effects of Swap Lines

Calibration

· Calibrate to Argentina without swaps (as in Roch & Roldán, 2023)

	Parameter	Value
Sovereign's discount factor	β	0.9852
Sovereign's risk aversion	γ	2
Preference shock scale parameter	χ	0.02
Lender's bargaining power	θ	0.5
Risk-free interest rate	r	0.01
Duration of debt	ho	0.05
Income autocorrelation coefficient	$ ho_{z}$	0.9484
Standard deviation of y_t	σ_{z}	0.02
Reentry probability	ψ	0.0385
Default cost: linear	d_0	-0.24
Default cost: quadratic	d_1	0.3

Default Barriers with Swaps

· Unrestricted: default barrier moves inward, Limited: marginal impact

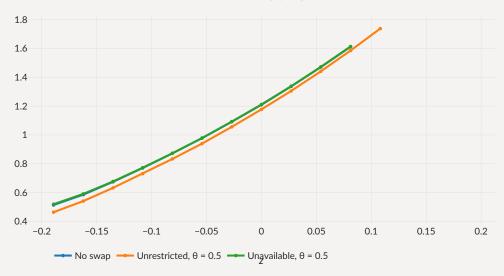

Debt levels at which P(b,m,z) crosses 50%

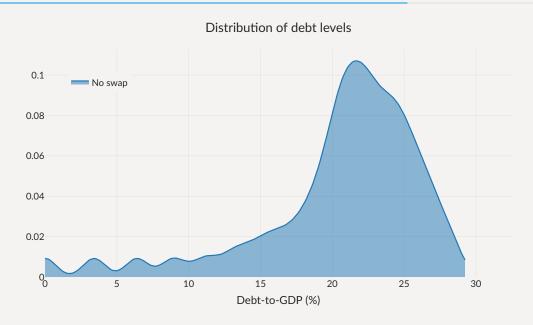

Default Barriers with Swaps

· Unrestricted: default barrier moves inward, Limited: marginal impact

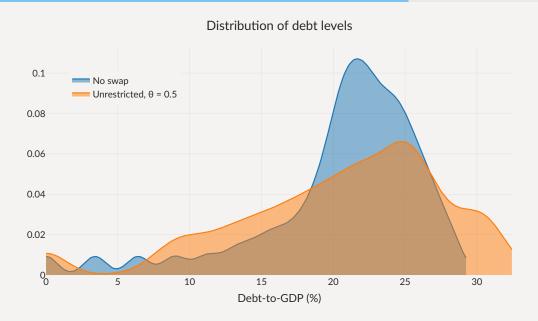

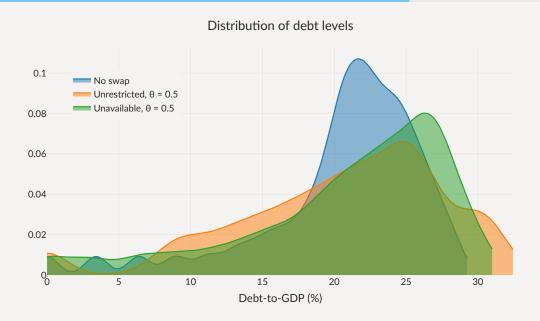

Debt Levels with Swaps

Debt Levels with Swaps

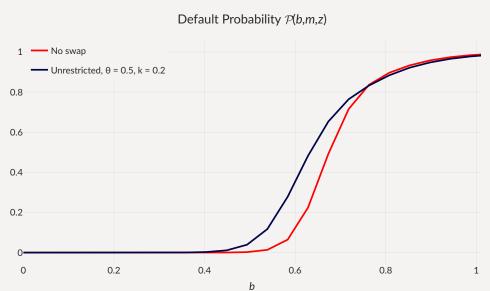

Debt Levels with Swaps

Debt Tolerance with Swaps

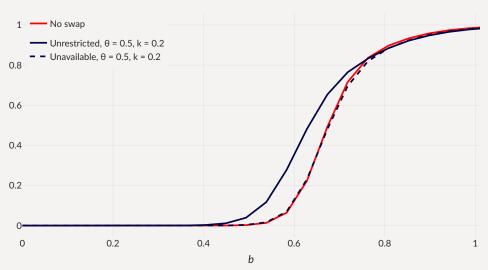

Repay less often with swaps. More often with Limited

Debt Tolerance with Swaps

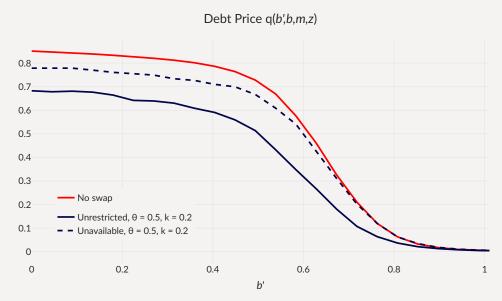

Repay less often with swaps. More often with Limited

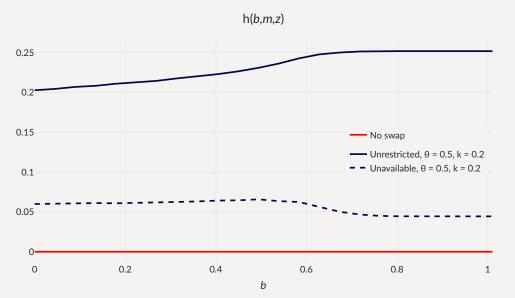

Debt Prices with Swaps

Limited: more likely to repay but lower prices \longrightarrow Tell-tale sign of debt dilution

Monopolist's profits

 $Monopolist's \ profits \ increasing \ in \ debt \ (cond. \ on \ repayment) - surplus \ requires \ spreads > 0$

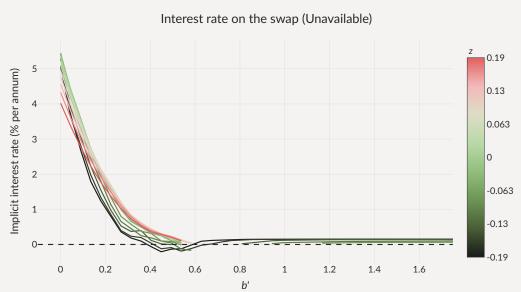

Risk-taking incentives

Surplus on swap requires spreads > 0: monopolist provides incentives for risk taking

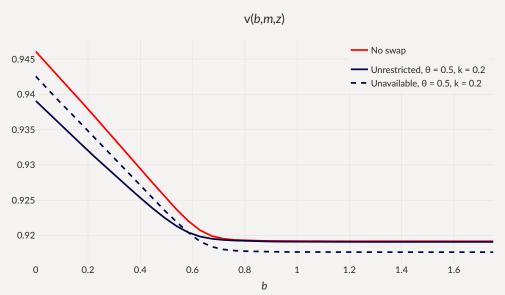

Risk-taking incentives

Surplus on swap requires spreads > 0: monopolist provides incentives for risk taking

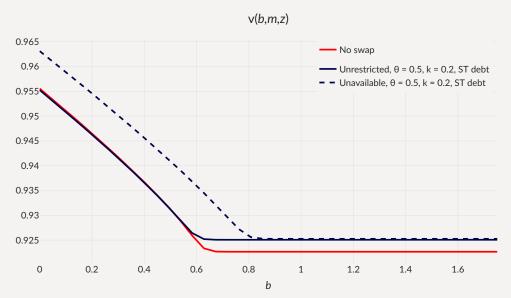

Welfare effects of swap lines

 $Limited \succcurlyeq Unrestricted, but...$

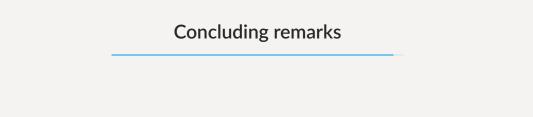

Welfare effects of swap lines — Short-term debt

Solving model with short-term debt: gains of swaps

Welfare effects of swap lines — Short-term debt (cont'd)

Concluding remarks

- Simple model with monopolist/fringe structure
- · Strong interaction between two markets for sovereign debt
 - ... even if swaps are **not** used intensely on the equilibrium path
- · Market power crucial in model
 - ... how to discipline in model?
 - ... how to affect in reality?
- · Large welfare effects, policy challenges
 - How to limit their use during defaults?
 - Strengthened debt dilution more gains from fiscal rules, state-contingent debt?

· Further conditioning on default events lasting exactly two years

· With Limited
