DebtCon 8
Washington DC, November 2025

Official Sovereign Debt

- A large share of sovereign borrowing takes the form of official debt
  - … Multilaterals, development banks, other governments

- Emergence of new bilateral creditors **outside** the Paris Club ▸ IDS data
  - … with claims to seniority and sometimes **opaque** terms

> **Questions**
> - How does the presence of a large senior lender affect sovereign debt markets?
> - What are its welfare implications for borrowing governments?

Official Sovereign Debt

- A large share of sovereign borrowing takes the form of official debt
    - … Multilaterals, development banks, other governments

- Emergence of new bilateral creditors **outside** the Paris Club ▸ IDS data
    - … with claims to seniority and sometimes **opaque** terms

| Questions |
|---|
| · How does the presence of a large senior lender affect sovereign debt markets? |
| · What are its welfare implications for borrowing governments? |

Evaluating Senior Official Creditors

Quantitative sovereign debt model with

- Competitive creditors in private markets
- Large bilateral lender
  1. Superior enforcement
     [de-facto seniority]
  2. Bargained terms
     [price and quantity]
  3. Short-maturity loans

- Prime example: Central Bank **swap** lines
  (Horn et al., 2021)

- Focus on the **interaction** between both funding sources

Bonds → **Markets** (Bondholders)

Government

Negotiated loans → **Bilateral** (e.g., Swap Lines)

Relational Overborrowing

Main findings

- Bilateral loans have significant effects on equilibrium outcomes
  - … provide funding when other sources dry up (e.g. because of default risk) ▲
  - … can also incentivize more **risk-taking** ▼

- If the rate on bilateral loans is decreasing in *market* debt   [cross-elasticity]
  - … government issues market debt more quickly, delevers more slowly
  - … spends longer in the risky region
  - … defaults more frequently
  - … welfare losses for the government

- Cross-elasticity can emerge endogenously from bargaining 📞
  - … at plausible values for bargaining weights
  - … increased frequency of defaults dominates extra liquidity
  - … **relational overborrowing**

Theory

- Enter period t owing b to bondholders, m to monopolist, income $y(z)$

Period t starts　　　　　　　　　　　　　　　　　　　　　　　　　　　**Period t ends**

Private debt markets		Monopolist		
Default choice	Debt issuance	Bargaining	Consumption	$z' \sim F(\cdot \mid z)$

(b, m, z)　　　　　　　　　(b', b, m, z)　　　(b', b, x, m', z)　　　(b', m', z)

Timeline of Events

- Choose to repay or default the *market* debt subject to convex output costs

Period t starts   **Period t ends**

| | Private debt markets | Monopolist | |
| Default choice | Debt issuance | Bargaining | Consumption | $z' \sim F(\cdot \mid z)$ |

(b, m, z) $\qquad\qquad$ (b', b, m, z) $\qquad$ (b', b, x, m', z) $\qquad$ (b', m', z)

$$v(b, m, z) = \max \left\{ v_R(b, m, z) + \epsilon_R, v_D(m, z) + \epsilon_D \right\}$$

- If repaid, issue new debt b' in markets at price q

Period t starts

Period t ends

Private debt markets | Monopolist

Default choice | **Debt issuance** | Bargaining | Consumption | $z' \sim F(\cdot \mid z)$

(b, m, z) | (b', b, m, z) | (b', b, x, m', z) | (b', m', z)

$$q(b', b, m, z) = \beta_L \mathbb{E}\left[(1 - \mathbf{1}_{\mathcal{D}}(b', m', z'))(\kappa + (1 - \delta)q(b'', b', m', z')) \mid z\right]$$

- Meet with senior lender, decide any transfers x and new/remaining balance m'

Period t starts   **Period t ends**

	Private debt markets		Monopolist		
	Default choice	Debt issuance	Bargaining	Consumption	$z' \sim F(\cdot \mid z)$
(b, m, z)		(b', b, m, z)	(b', b, x, m', z)	(b', m', z)	

- Consume output plus revenues from debt issuance plus transfers minus debt service

Period t starts   **Period t ends**

Private debt markets   Monopolist

Default choice   Debt issuance   Bargaining   **Consumption** $z' \sim F(\cdot \mid z)$

(b, m, z) (b', b, m, z) (b', b, x, m', z) (b', m', z)

$$c_R = y(z) + q(b', b, m, z)(b' - (1 - \delta)b) + x_R(b', b, m, z) - \kappa b$$

Exogenous Bilateral Terms

- Explore interest rate rules of the form

$$r(b', m') = \max\{r^\star, \alpha_0 + \alpha_b b' + \alpha_m m'\}$$

- Two versions

Size-dependent	Risk-inducing
$\alpha_0 > 0, \alpha_b = 0, \alpha_m > 0$	$\alpha_0 > 0, \alpha_b < 0, \alpha_m = 0$

- Explore interest rate rules of the form

$$r(b', m') = \max\{r^\star, \alpha_0 + \alpha_b b' + \alpha_m m'\}$$

- Two versions

Size-dependent

$\alpha_0 > 0, \alpha_b = 0, \alpha_m > 0$

Risk-inducing

$\alpha_0 > 0, \alpha_b < 0, \alpha_m = 0$

Equilibrium with Exogenous Rules

- 'Only market' standard calibration to Argentina 1993-2001

	Only market	Size dependent r	Risk inducing r

Surplus on loan requires spreads: relationship provides incentives for risk taking

Loan interest rate (Limited)

Concluding remarks

The Perils of Bilateral Sovereign Debt

- Simple model of borrowing from markets and a senior bilateral lender
  - … strong interaction between two markets for sovereign debt
  - … even if bilateral loans are **not** used intensely on the equilibrium path

- **Dangerous** when bilateral interest rate responds negatively to *market* debt
  - … cross-elasticity induces risk-taking, more defaults, welfare losses
  - … Bargaining as an example of situation where cross-elasticity emerges

- Cross-elasticity constitutes a simple test to assess welfare gains of **new** instruments
 - … or a boost to the gains of fiscal rules, state-contingent debt…
